

OpenTX Documentation: Corrections and 2.1.9 Updates

September 2016

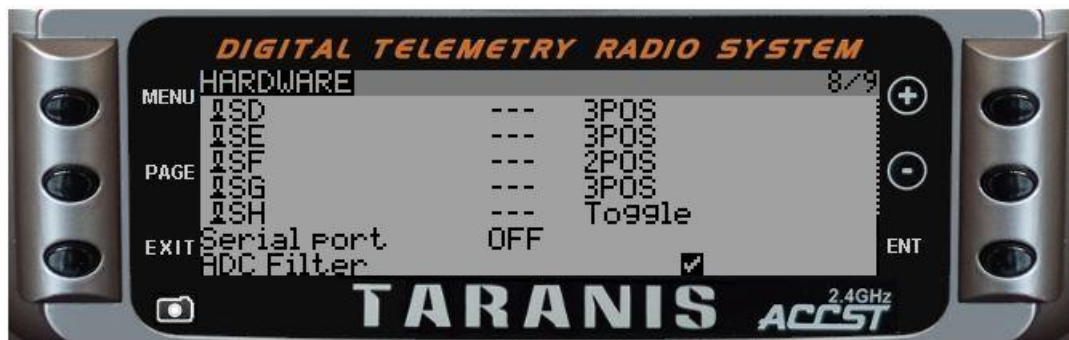

This document lists the errors found so far, one or two additions to the documentation and provides an update for new items in 2.1.9

Corrections

1. [Reference Section 1, The Basics" page 14.](#)
 - a. The notes for **Internalppm** and **ppmus** are reversed.
 - b. **Masstorage** To explain this a little better, if you tick the **masstorage** box, then connecting the Taranis to a computer using a USB lead will allow the computer to detect the Taranis files in the same way it does when in bootloader mode. Otherwise the Taranis will be detected as a joystick.
2. [Reference Section 3, Part 2 page 55](#)
 - a. Gspd is ground speed not air speed.

OpenTX 2.1.9

2.2.9 mainly fixes a few bugs, however there is one new option available. This is to turn off or on the jitter filter. This is on screen 8 of the Radio Setup screens. Note that improvements have also been made to this filter to reduce the jitter.

Details of all the changes in 2.1.9 can be found on the OpenTX website.
